

3D visualisation assists mines present data

By Deborah Spicer

Venmyn Interaction has introduced a new product to its portfolio – a 3D visualisation product, which can be customised to show the pertinent aspects of a mining operation or processing plant.

The company can offer animations to show a mine's site development over time, visualisation of its orebody from a variety of perspectives, fly overs of the mine site and the area in which it is located, and can even allow viewers to seamlessly move between below and above-ground sites, including into associated processing plants.

The video clips, which can vary in length according to needs, can be used on websites, in presentations or distributed to investors interested in understanding a mining operation, describes Venmyn Interaction director Tanya Galbraith.

Besides being visually appealing, the clips are also informative, since they can include professional voiceovers that guide the viewer through the clip, she says.

Interaction, which is Venmyn's sister company, has long been associated with the graphics in Venmyn's reports and technical statements, and provides a competitive advantage to Venmyn and its clients, who value the highly-graphic and easy-to-understand format of Venmyn's reports.
